▣ Input & output connections

◎ In case of operating the load by power supply of the sensor

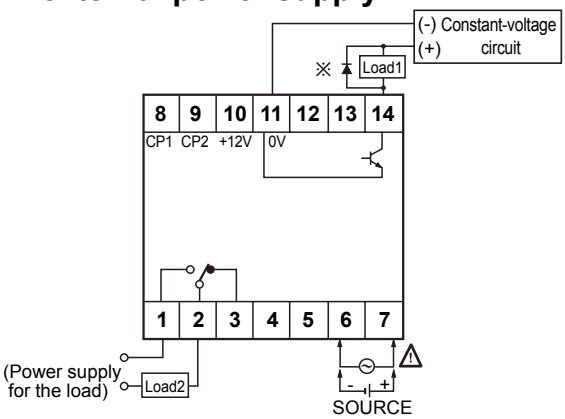

● Please select proper capacity of load, because total value of load capacity and current consumption should not be exceed current capacity.(Max. 50mA)

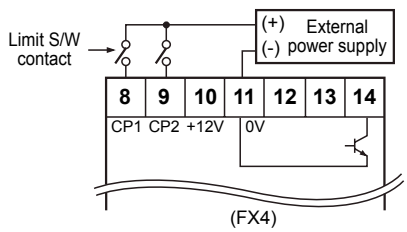

◎ How to count by external power supply

This unit starts to count when "High" level(5-30VDC) is applied at CP1 or CP2 after selecting PNP.

◎ In case of operating the load by external power supply

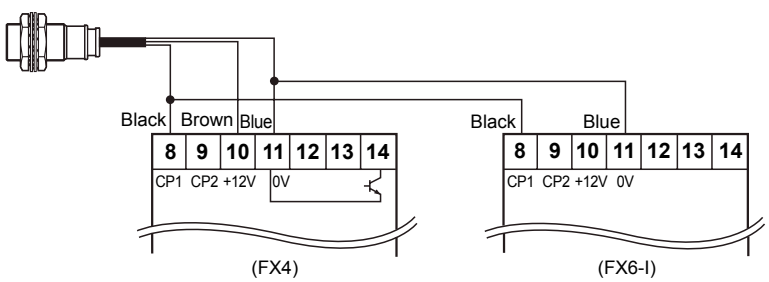

● The capacity of the load must not be exceed max. 30VDC, max. 100mA of the switching capacity of the transistor.
● Please do not supply the reverse polarity voltage.
※Please connector the surge absorber(Diode) at both terminals of the load, in case of using the inductive load. (Relay, etc.)

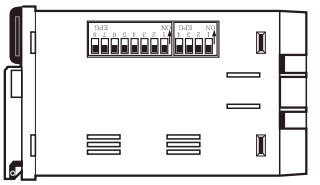

◎ Using 2 counters with one sensor

Please connect as the power of sensor is supplied from only one of counters and design input logic with same way.

▣ Proper usage

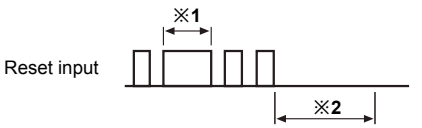

◎ Reset

● Reset

In case of changing the input mode after supplying the power, please provide an external reset or manual reset. If reset is not executed, the counter will be working in previous mode.

● Reset signal width

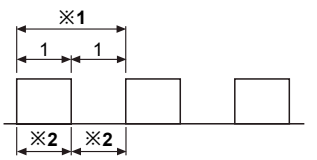

To guarantee proper reset, the signal must be supplied for a minimum of min. 20ms regardless the signal comes from a contact or a solid-state input.

※1: In case of a contact reset, contact chattering will not affect the reset as long as it is applied for a minimum of 20ms.

※2: Input signal at CP1 & CP2 must be applied for a minimum of 50ms after the reset is removed.

◎ Mini. count signal width

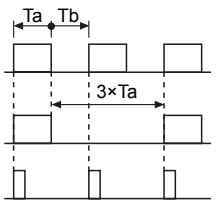

※1: Please make duty ratio(ON/OFF) as 1:1.

※2: Min. signal width
- 1cps : Min. 500ms
- 30cps : Min. 16.7ms
- 2kcps : Min. 0.25ms
- 5kcps : Min. 0.1ms

◎ Max. counting speed

This is a response speed per 1 sec. when the duty ratio (ON:OFF) of input signal is 1:1. If the duty ratio is not 1:1, the width between ON and OFF should be over min. signal width and the response speed will getting slower against input signal. If either ON or OFF signal is shorter than minimum signal width, this product may not respond.

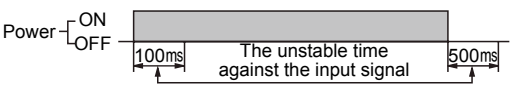

Ta(ON width) and Tb(OFF width) needed to be over min.signal width.

Max. counting speed is 1/2 value of rated spec. when duty ratio is 1:3.

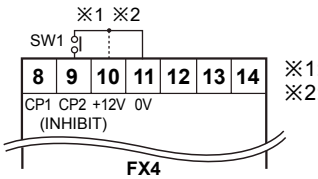

It can not respond if it is smaller than min. singal width(Ta).

◎ Power

The inner circuit voltage starts to rise up for the first 100ms after power on, the input may not work at this time. And also the inner circuit voltage drops down for the last 500ms after power off, the input may not work at this time.

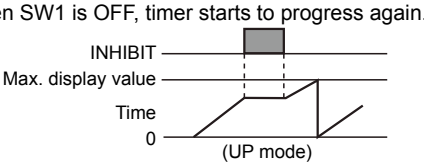

◎ INHIBIT(For timer)

※1: Connection for PNP
※2: Connection for NPN

- INHIBIT mode is active when SW1 turns ON. (Time Hold)
- When power is applied, it starts to progress and INHIBIT mode is used to stop the time is under the progress at the moment.
- When SW1 is OFF, timer starts to progress again.

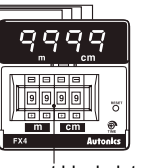

◎ How to use the sticker

The below sticker can be found inside the box.
Use the sticker according to application as follow;

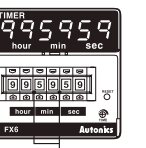

Ex1) Measurement of length by the rotary encoder

ENC-1-2-T-24

Please put black dot.

EX2) Timer[F mode]

◎ Error display

Error signal	Error description	Returning method
Err0	When 2nd setting value is 0	Change the setting value to non zero status
	When 2nd setting value is smaller than 1st setting value	Make 2nd setting value bigger than 1st setting value

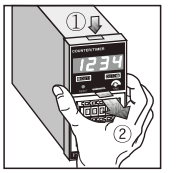

※There is no Error display function in indication type.
※There is no Error function in indicator.
※When Error is display, the OUTPUT continues OFF state.
※1st output maintains OFF status by 1st setting value as 0.
